Soccer league - How the system is used

Written for testing. Based on what the code of the soccer sample does.

Who uses it

- League staff: they register teams and players, create matches and competitions, and record what happens in a match.
- Administrators: they do what the staff do and, in addition, delete teams and reset the goals of a team.
- Other systems: they read teams, players and matches.

Before the season

- The staff create each team with its city, country and coach.
- They add the players of each team, one by one.
- They create the competitions of the season and register each team in the ones it will play.
- If a player leaves, the staff remove the player from the team by the shirt number.

On match day

- The staff create the match with the two teams and the stadium.
- During the match, each goal is recorded as it happens: the team, the shirt number of the scorer and the minute.
- Anyone can ask for the match at any time to see the scoreboard.
- When the referee ends the match, the staff finish it. After that the result does not change.

After the match

- The team page shows how many players the team has, their average age and the top scorer.
- The list of players can be filtered by position.

What must be fast (assumptions)

- This part is not in the code. It was written for the tests of this repository and should be confirmed by a person who knows the league.
- Recording a goal should feel immediate: it happens live and the person recording it cannot wait.
- Showing the scoreboard of a match should be fast: many readers ask for it during a match.
- Registering teams, players and competitions is done before the season, by a few people. It does not need to be fast.

What belongs together (assumptions)

- This part is not in the code either.
- The squad of a team is managed by one group of people, before the season.
- Matches and their goals are managed by another group, on match day.
- Competitions change once a season.
